**RACCOON-RABIES VACCINATION GROUND BAITING IN MAHONING COUNTY  
SLATED FOR SEPTEMBER 12 - 14, 2011**  
*Operations May be Extended due to Weather*

The Mahoning County District Board of Health and Youngstown City Health District with the assistance of the Mahoning-Columbiana Medical Reserve Corps (MRC) will begin fall oral rabies vaccination (ORV) ground operations September 12 to 14, 2011.

The Ohio Departments of Health (ODH) and Natural Resources (ODNR), in partnership with the U.S. Department of Agriculture Animal and Plant Health Inspection Service, Wildlife Services program and local health departments (LHDs) began fall oral rabies vaccination (ORV) operations Tuesday, September 6 in 14 northeast and eastern Ohio counties.

“This local, state and federal partnership shows a commitment to controlling raccoon-rabies variant in Ohio,” says health commissioner Matthew Stefanak, MPH. “Please show your commitment and prevent the spread of raccoon rabies by vaccinating your pets.”

As in past years, vaccine-bait distribution will take place in all of Ashtabula, Columbiana, Geauga, Jefferson, Lake, Mahoning and Trumbull counties and parts of Belmont, Carroll, Cuyahoga, Harrison, Monroe, Portage, and Summit counties. Baits will be distributed by various methods in each county, including fixed-wing aircraft, helicopter and LHD staff in vehicles.

Residents in the areas to be baited should be aware of low-flying aircraft and should keep children and pets away from the baits.

Rabies is a viral disease that affects mammals and people. It is almost always fatal. Since the mid-1970s, a rabies variant associated with raccoons spread rapidly through the eastern United States. Rabies vaccine baiting operations are intended to create an immune barrier to prevent the spread of raccoon-rabies variant (RRV) into the rest of the state. These regular rabies vaccination efforts began in 1997 and have been successful in suppressing rabies in affected areas and protecting the rest of the state. As of July 11, 2011, three cases in animals have been confirmed RRV positive from northeastern Ohio, (all from Ashtabula County). In 2010, six rabid animals three from Lake County, and one from each of Mahoning, Trumbull, and Guernsey counties) were confirmed.

Weather permitting, baiting will begin Tuesday, September 6, 2011 and will cover 4,334 square miles of the state's northeastern and eastern border. Aerial distribution should be complete within 10 days; ground baiting may continue through September 30 depending on weather.

Two types of baits will be used. In rural areas, airplanes will drop a small plastic sachet, about the size of a ketchup packet, coated in fishmeal. In urban areas, the vaccine will be inside a hard, brown, 2-x-2-inch fishmeal block that will be distributed by vehicles staffed by LHD and other local agency volunteers. Most of the 761,883 baits will be distributed by air, with the use of specially equipped white Beechcraft King Air planes from Dynamic Aviation and a helicopter.

Residents should avoid the baits and keep pets confined during the baiting period. Dogs in particular are attracted to the baits and will occasionally eat them. The baits are not harmful to pets. Please keep the following information in mind:

- Know what the baits look like. The coated sachet, which will be distributed by aircraft, is about the size of a ketchup packet. It is white and rolled in a brown fishmeal glaze. In urban areas, where baits will be distributed by vehicle, the sachet will be inside a hard, brown fishmeal block, about 2-x-2-inch square.
- Instruct children to leave the baits alone.
- Once your area is baited, keep dogs and cats inside or on leashes for up to five days. Most bait disappears within 24 hours; however, it is important raccoons have every opportunity to eat them.
- Do not attempt to take bait away from your pet; you may be bitten.
- Anyone handling baits should wear gloves. If baits are found in areas frequented by pets or children, toss them into deeper cover. Damaged baits can be disposed of in the trash.
- If a person is exposed to the vaccine (red liquid), thoroughly wash any areas of the skin that came into contact with the vaccine with soap and water.
- If someone has been exposed to the vaccine or has questions about the baiting, call your LHD or ODH's information line at 1-888-722-4371.

The rabies virus is found in the saliva of affected animals, most often raccoons, skunks and bats, and is spread by a bite or scratch. Bats, raccoons and skunks pose the greatest risk of rabies in Ohio. To protect your family against this still-deadly disease:

- Avoid contact with wild animals and animals you do not know.
- Vaccinate your pets against rabies and keep them current on their shots.
- If bitten, call your doctor. If your pet has contact with a wild animal, call your veterinarian. Rabies exposures should also be reported to your LHD.

Ohio's partners in the multistate baiting are Maryland, North Carolina, Pennsylvania, Tennessee, Virginia and West Virginia, in what is known as the Appalachian Ridge ORV program. The seven-state effort will involve distribution of about 5 million baits and cover more than 26,000 square miles. ODH has participated in the program since 1997 and almost 13 million baits have been distributed in Ohio over that time.
